E. Other Teaching Activities

- Developed and taught a new graduate course entitled *Spatial-Temporal Processing for Wireless Communications* (ECE8823) in fall 2002: This course introduces current research results in spatial-temporal processing for wireless communication systems to improve performance and increase capacity. It includes receive antenna arrays for diversity and interference suppression, transmit diversity approaches (including linear filter based approaches, space-time block coding, and space-time trellis coding), and MIMO techniques.
- Developed and taught a new graduate course entitled *Fundamental Broadband Communications* (ECE8853) in spring 2011: This course examines the fundamental issues of broadband communications and it covers optimal sequence detection, time- and frequency-domain equalization, OFDM and DMT, MIMO techniques, multi-user systems.
- Reshaping existing undergraduate course *Circuits Analysis* (ECE2040): As Curriculum committee member of the course, worked with other members to revise the curriculum of ECE2040. Helped add experimental elements in the course.
